# **LZI Ketamine Enzyme Immunoassay**

Lin-Zhi International, Inc. For EU Use Only

# **Intended Use**

The LZI Ketamine Enzyme Immunoassay is intended for the qualitative and semi-quantitative determination of norketamine in human urine at the cutoff value of 50 ng/mL when calibrated against norketamine. The assay is designed for use with a number of automated clinical chemistry analyzers. The semi-quantitative mode is for purposes of enabling laboratories to determine appropriate dilution of the specimen for verification by a confirmatory method such as GC/MS or LC/MS, or permitting laboratories to establish quality control procedures.

The assay provides only a preliminary analytical result. A more specific alternative chemical confirmatory method (e.g., gas or liquid chromatography and mass spectrometry) must be used to obtain a confirmed analytical result (1,2). Clinical consideration and professional judgment should be exercised with any drug of abuse test result, particularly when the preliminary test result is a preliminary positive.

#### **Summary and Explanation of Test**

Ketamine (2-[2-chlorophenyl]-2-[methylamino]-cyclohexanone) is a pharmaceutical derived from phencyclidine (PCP) and cyclohexamine. Mechanistically, it acts as a non-competitive N-methyl-D-aspartate (NMDA)-receptor antagonist. The NMDA-receptor is involved in sensory input at the spinal, thalamic, limbic and cortical levels (3, 4).

Ketamine has been shown to have a number of beneficial pharmacological properties. It is primarily considered an anaesthetic with a good safety profile. (5) Its major drawback, limiting its clinical use, is the occurrence of emergence reactions or dissociative effects (e.g., hallucinations, vivid dreams, floating sensations and delirium.) (3, 6). Recently, extensive research has been carried out on the antidepressant properties of ketamine (7-9).

The frequent use of ketamine can lead to addiction and dependence (10). Ketamine possesses narcotic effects similar to phencyclidine (PCP) and hallucinogenic effects similar to lysergic acid diethylamide (LSD) (11, 12). The recreational use of ketamine as a rave, party, and nightclub drug has increased over time, thus increasing public concerns about the potential hazards of this drug (13-15).

Ketamine undergoes rapid N-demethylation by liver microsomal cytochrome P450 enzymes CYP 3A4, CYP 2B6, and CYP 2C9 to form its primary metabolite, norketamine, which is pharmacologically active, and an inactive metabolite, 6-hydroxynorketamine (16, 17). A small percentage of unchanged ketamine (2.3%), norketamine (1.6%), and dehydronorketamine (16.2%) are eliminated in urine, whereas 80% is present as the glucuronide conjugates of hydroxylated metabolites of ketamine (18-21). While dehydronorketamine is present at higher levels and for a longer period of time than ketamine and norketamine in urine, dehydronorketamine has a lower stability, potentially limiting its utility in the detection of ketamine abuse (22).

#### **Assay Principle**

The LZI Ketamine Enzyme Immunoassay is a homogeneous enzyme immunoassay ready-to-use liquid reagent. The assay is based on competition between drug in the sample and drug labeled with the enzyme glucose-6phosphate dehydrogenase (G6PDH) for a fixed amount of antibody in the reagent (23). The drug-labeled G6PDH conjugate is traceable to a commercially available ketamine standard and referred to as ketamine-labeled G6PDH conjugate. Enzyme activity decreases upon binding to the antibody, and the norketamine concentration in the sample is measured in terms of enzyme activity. In the absence of ketamine and/or norketamine in the sample, ketamine-labeled G6PDH conjugate is bound to antibody, and the enzyme activity is inhibited. On the other hand, when ketamine and/or norketamine is present in the sample, antibody would bind to free ketamine and/or norketamine; the unbound ketamine-labeled G6PDH then exhibits its maximal enzyme activity. Active enzyme converts nicotinamide adenine dinucleotide (NAD) to NADH, resulting in an absorbance change that can be measured spectrophotometrically at 340 nm.

## **Reagents Provided**

Antibody/Substrate Reagent ( $R_1$ ): Contains a mouse monoclonal anti-ketamine antibody, glucose-6-phosphate (G6P), nicotinamide adenine dinucleotide (NAD), stabilizers, and sodium azide (0.09 %) as a preservative. Enzyme-drug Conjugate Reagent ( $R_2$ ): Contains glucose-6-phosphate dehydrogenase (G6PDH) labeled with ketamine in buffer with sodium azide (0.09 %) as a preservative.

# Calibrators and Controls\*

\*Calibrators and Controls are sold separately or as a semi-quantitative set and contain negative human urine with sodium azide as a preservative.

Norketamine Cutoff Calibrators	REF
Negative Calibrator	0001
Low Calibrator: Contains 25 ng/mL norketamine	0662
Cutoff #1 Calibrator: Contains 50 ng/mL norketamine	0663
Cutoff #2 Calibrator: Contains 100 ng/mL norketamine	0664
Intermediate Calibrator: Contains 250 ng/mL norketamine	0665
High Calibrator: Contains 500 ng/mL norketamine	0666

Norketamine Cutoff Controls	REF
Level 1 Control: Contains 37.5 ng/mL norketamine	0667
Level 2 Control: Contains 62.5 ng/mL norketamine	0668

## **Precautions and Warning**

- This test is for in vitro diagnostic use only. Harmful if swallowed.
- Reagent contains sodium azide as a preservative, which may form
  explosive compounds in metal drain lines. When disposing such reagents or
  wastes, always flush with a large volume of water to prevent azide buildup. See National Institute for Occupational Safety and Health Bulletin:
  Explosive Azide Hazards (24).
- Do not use the reagents beyond their expiration dates.

#### **Reagent Preparation and Storage**

The reagents are ready to use. No reagent preparation is required. All assay components should be refrigerated at 2-8°C when not in use.

# Specimen Collection and Handling

Use fresh urine specimens for the test. If the sample cannot be analyzed immediately, it may be refrigerated at 2-8°C for seven days. For longer storage, keep sample frozen at -20°C and then thaw before use (22). Adulteration may cause erroneous results. If sample adulteration is suspected, obtain a new sample and both samples should be forwarded to a laboratory for testing.

Handle all urine specimens as if they are potentially infectious.

#### **Instrument**

Clinical chemistry analyzers capable of maintaining a constant temperature, pipetting sample, mixing reagents, measuring enzyme rates at 340 nm and timing the reaction accurately can be used to perform this homogeneous immunoassay.

Performance characteristics presented in this package insert have been validated on the Beckman Coulter AU480 automated clinical analyzer.

# **Assay Procedure**

Refer to the specific parameters used for each analyzer before performing the assay. For qualitative analysis use the 50 ng/mL as the cutoff calibrator. For semi-quantitative analysis, use all six calibrators including the universal negative calibrator. Recalibration should be performed after reagent bottle change or a change in calibrators or reagent lot. Two levels of controls are available for monitoring of each cutoff level. Use the 37.5 ng/mL and 62.5 ng/mL controls for the 50 ng/mL cutoff level.

# **Calibration and Quality Control**

Good laboratory practices recommend the use of at least two levels of control specimens (one positive and one negative control near the cutoff) to ensure proper assay performance. Controls should be run with each new calibration and after specific maintenance or troubleshooting procedures as detailed in the instrument system manual. Each laboratory should establish its own control frequency. If any trends or sudden change in control value are observed, review all operating parameters, or contact LZI technical support for further assistance. Laboratories should comply with all federal, state, and local laws, as well as all guidelines and regulations.

#### Results

**Note:** A positive test result does not necessarily mean a person took a specific drug and a negative test result does not necessarily mean a person did not take a specific drug. There are a number of factors that influence the reliability of drug tests.

**Qualitative:** The cutoff calibrator, which contains 50 ng/mL of norketamine, is used as a reference for distinguishing positive from negative samples. A sample with a change in absorbance ( $\Delta$ mAU) equal to or greater than that obtained with the cutoff calibrator is considered positive. A sample with a change in absorbance ( $\Delta$ mAU) lower than that obtained with the cutoff calibrator is considered negative.

**Semi-Quantitative**: The semi-quantitative mode is for purposes of (1) enabling laboratories to determine an appropriate dilution of the specimen for verification by a confirmatory method such as GC/MS, LC/MS or (2) permitting laboratories to establish quality control procedures. When an approximation of concentration is required, a calibration curve can be established with six calibrators. The concentration of norketamine in the sample may then be estimated from the calibration curve.

#### Limitations

- A preliminary positive result from this assay indicates only the presence of norketamine. The test is not intended for quantifying this single analyte in samples.
- 2. A preliminary positive result does not necessarily indicate drug abuse.
- 3. A negative result does not necessarily mean a person did not take illegal drugs.
- Care should be taken when reporting results, as numerous factors (e.g., fluid intake, endogenous or exogenous interferants) may influence the urine test result.
- Preliminary positive results must be confirmed by other affirmative, analytical methods (e.g., chromatography), preferably GC/MS or LC/MS.
- 6. The test is designed for use with human urine only.
- 7. This test should not be used for therapeutic drug monitoring.

## **Typical Performance Characteristics**

The results shown below were performed with a single Beckman Coulter AU480 automated chemistry analyzer.

#### Precision:

<u>Semi-quantitative analysis</u>: The following concentrations were determined with reference curves from six calibrators. Typical results (ng/mL) are as follows:

50 ng/mL Cutoff			n Run = 22)	Run-to-Run (N = 88)	
Norketamine	% of	#	EIA	#	EIA
Concentration	Cutoff	Samples	Result	Samples	Result
0 ng/mL	0 %	22	22 Neg	88	88 Neg
12.5 ng/mL	25 %	22	22 Neg	88	88 Neg
25 ng/mL	50 %	22	22 Neg	88	88 Neg
37.5 ng/mL	75 %	22	22 Neg	88	88 Neg
50 ng/mL	100 %	22	3 Neg/	88	15 Neg/
30 ng/mb	100 /0		19 Pos	00	73 Pos
62.5 ng/mL	125 %	22	22 Pos	88	88 Pos
75 ng/mL	150 %	22	22 Pos	88	88 Pos
87.5 ng/mL	175 %	22	22 Pos	88	88 Pos
100 ng/mL	200 %	22	22 Pos	88	88 Pos

 $\label{eq:Qualitative analysis: The following concentrations were evaluated. Typical qualitative results (measured by \DeltaOD, mAU) are as follows:$ 

50 ng/mL Cutoff		Within Run $(N = 22)$		Run-to-Run (N = 88)	
Norketamine Concentration	% of Cutoff	# Samples	EIA Result	# Samples	EIA Result
0 ng/mL	0 %	22	22 Neg	88	88 Neg
12.5 ng/mL	25 %	22	22 Neg	88	88 Neg
25 ng/mL	50 %	22	22 Neg	88	88 Neg
37.5 ng/mL	75 %	22	22 Neg	88	88 Neg
50 ng/mL	100 %	22	1 Neg/ 21 Pos	88	8 Neg/ 80 Pos
62.5 ng/mL	125 %	22	22 Pos	88	88 Pos
75 ng/mL	150 %	22	22 Pos	88	88 Pos
87.5 ng/mL	175 %	22	22 Pos	88	88 Pos
100 ng/mL	200 %	22	22 Pos	88	88 Pos

**Accuracy:** One hundred eleven (111) urine specimens and pooled urine samples spiked with norketamine were tested with the LZI Ketamine Enzyme Immunoassay and confirmed with LC/MS. Specimens with a combined norketamine and ketamine concentration greater than or equal to 50 ng/mL by LC/MS are defined as positive, and specimens with a combined norketamine and ketamine concentration below 50 ng/mL by LC/MS are defined as negative in the table below. Near cutoff samples are defined as  $\pm$  50 % of the cutoff value. The correlation results are summarized as follows:

Semi-Quantitative Accuracy Study:

50 ng/mL Cutoff	Neg	< 50 % of the cutoff	Near Cutoff Neg	Near Cutoff Pos	High Pos	% Agree- ment
Positive	0	2*	2**	6	62	100.0 %
Negative	20	4	15	0	0	90.7 %

The following table summarizes the results for the semi-quantitative discordant samples:

Sample #	NKET LC/MS (ng/mL)	KET LC/MS (ng/mL)	Total NKET + KET LC/MS (ng/mL)	Pos/ Neg Result	AU480 EIA Semi- Quantitative Result (ng/mL)	Pos/ Neg Result
24*	17.0	0.0	17.0	1	227.9	+
26*	19.6	0.0	19.6	-	228.2	+
31**	14.3	12.8	27.1	-	133.2	+
34**	0.0	32.3	32.3	-	58.3	+

Qualitative Accuracy Study:

50 ng/mL Cutoff	Neg	< 50 % of the cutoff	Near Cutoff Neg	Near Cutoff Pos	High Pos	% Agree- ment
Positive	0	2*	2**	6	62	100.0 %
Negative	20	4	15	0	0	90.7 %

The following table summarizes the results for the qualitative discordant samples:

Sample #	NKET LC/MS (ng/mL)	KET LC/MS (ng/mL)	Total NKET + KET LC/MS (ng/mL)	Pos/ Neg Result	AU480 EIA Qualitative Result (mAU)	Pos/ Neg Result
24*	17.0	0.0	17.0	-	308.2	+
26*	19.6	0.0	19.6	-	312.1	+
31**	14.3	12.8	27.1	-	190.8	+
34**	0.0	32.3	32.3	-	90.9	+

Calibration Cutoff Average = 69.3 mAU

**Analytical Recovery:** To demonstrate recovery for purposes of sample dilution and quality control of the entire assay range, a drug free—urine pool spiked with norketamine at 500 ng/mL was serially diluted. Each sample was run in 10 replicates and the average was used to determine percent recovery compared to the expected target value.

Target Concentration (ng/mL)	Determined Concentration Range (ng/mL)	Determined Concentration Average (ng/mL)	Average % Recovery
500	500.3 - 523.8	512.8	102.6 %
450	470.3 – 489.6	479.8	106.6 %
400	404.6 - 446.4	424.5	106.1 %
350	356.8 - 372.5	364.8	104.2 %
300	290.8 - 318.4	305.1	101.7 %
250	243.8 - 254.0	247.8	99.1%
200	197.0 - 204.8	201.3	100.6 %
150	152.0 - 167.5	159.5	106.3 %
100	89.7 - 92.3	91.0	91.0 %
50	47.4 - 53.7	51.4	102.8 %
25	22.8 - 27.0	25.0	99.8 %
7.5	7.3 – 10.1	8.6	114.8 %
0	-1.3 – 2.4	0.6	N/A

**Specificity:** Various potentially interfering substances were tested for cross-reactivity with the assay. Test compounds were spiked into a drug-free urine pool to various concentrations and evaluated with the assay's calibration curve in both qualitative and semi-quantitative modes. The following table lists the concentration of each test compound that gave a response approximately equivalent to that of the cutoff calibrator (as positive) or the maximal concentration of the compound tested that gave a response below the response of the cutoff calibrator (as negative). Compounds tested at high concentration (100000 ng/mL) with results below the cutoff value were listed as Not Detected (ND). Compounds tested below the high concentration (100000 ng/mL) that gave a result below the cutoff value were given a "< %" value.

#### **Ketamine and Metabolites:**

	Cross-reactant	Concentration (ng/mL)	% Cross- reactivity
	Norketamine	50	100.00 %

Carbamazepine	10000	< 0.50 %	Neg	Pos

#### **Endogenous and Preservatives Compound Interference Study:**

Various potentially interfering endogenous and preservative substances were tested for interference with the assay. Test compounds were split into three portions each and either left un-spiked or spiked to a norketamine concentration of either 37.5 or 62.5 ng/mL (the negative and positive control concentrations, respectively). These samples were then evaluated in semi-quantitative and qualitative modes. Only the preservative Boric Acid (1 % w/v) was found to cause interference with the assay.

Endogenous or Preservative	Spiked [ ]	Spiked Norketamine Concentration		
Substance	(mg/dL)	0 ng/mL	37.5 ng/mL	62.5 ng/mL
Acetone	1000	Neg	Neg	Pos

Sodium Azide	1000	Neg	Neg	Pos
Sodium Chloride	3000	Neg	Neg	Pos
Sodium Fluoride	1000	Neg	Neg	Pos
Sodium Phosphate	300	Neg	Neg	Pos
Urea	6000	Neg	Neg	Pos
Uric Acid	10	Neg	Neg	Pos

The following compound which showed interference at  $\pm 25$  % of cutoff concentrations were then spiked into negative urine and at  $\pm 50$  % of cutoff concentrations (25 ng/mL and 75 ng/mL) for the assay. Interference was still observed with Boric Acid. Results are summarized in the following table:

Endogenous or Preservative	Spiked []	Spiked Norketamine Concentration		
Substance	(mg/dL)	0 ng/mL	25 ng/mL	75 ng/mL
Boric Acid	1000	Neg	Neg	Neg

# pH Interference Study:

pH 3 to pH 11 was tested for interference with the assay. Each pH level was split into three portions each and either left un-spiked or spiked to a norketamine concentration of either 37.5 ng/mL or 62.5 ng/mL (the negative and positive control concentrations, respectively). These samples were then evaluated in semi-quantitative and qualitative modes. No pH interference was observed.

pН	Spiked Norketamine Concentration			
	0 ng/mL	37.5 ng/mL	62.5 ng/mL	
pH 3	Neg	Neg	Pos	
pH 4	Neg	Neg	Pos	
pH 5	Neg	Neg	Pos	
pH 6	Neg	Neg	Pos	
pH 7	Neg	Neg	Pos	
pH 8	Neg	Neg	Pos	
pH 9	Neg	Neg	Pos	
pH 10	Neg	Neg	Pos	
pH 11	Neg	Neg	Pos	

**Specific Gravity:** Samples ranging in specific gravity from 1.000 to 1.025 were split into three portions each and either left un-spiked or spiked to a norketamine concentration of either 37.5 or 62.5 ng/mL (the negative and positive control concentrations, respectively). These samples were then evaluated in semi-quantitative and qualitative modes. No interference was observed.
